WO 03/085608 PCT/CH03/00192

PATENT CLAIMS

22

- 1. A device (20) for revealing security elements that are present in an object (8) and that have at 5 least one photoluminescent segment which characterized by linearly polarized absorption, characterized in that at least one UV light source, in particular preferably in the form of a UV diode (18), and at least one polarization filter (4, 30) are arranged 10 in such a way that the light from the light source linearly polarized (12)by is polarization filter (4), strikes the object (8) and, respectively, the photoluminescent segments present therein in a dark chamber 15 (17),photoluminescent light (16) from the segment the visible range can be observed through
- claimed 20 2. The device (20)as in claim characterized in that the at least one UV diode (18) is a diode which emits light in the UV range from 180 to 500 nanometers, preferably from 300 to 400 nanometers, in particular in the range from 25 350 to 380 nanometers, and in that the UV light source or UV diode (18) preferably provides an optical output in the range from 0.5 to 20 mW, in particular preferably from 1 to 5 mW, given a current of 15 to 20 mA and room temperature.

observation opening (10).

30
3. The device (20) as claimed in one of the preceding claims, characterized in that the device (20) can be handled and is constructed in the form of a hand-held instrument such as, for example, in the form of a small pen, it being possible, for example, for the object (8) to be illuminated with one end with the aid of a UV light beam oriented

WO 03/085608 PCT/CH03/00192

23

substantially parallel to the axis (19) and to be observed through an observation opening (10).

- 4. The device (20) as claimed in one of the preceding claims, characterized in that the observation can take place through a filter which substantially does not permit light in the wavelength range of the UV light source or UV diode (18) to pass, while light in the wavelength range of the visible photoluminescent light (16) from the segment can pass substantially unimpeded.
- 5. The device (20) as claimed in one of the preceding claims, characterized in that the polarization filter (4) for observation can be rotated about an axis perpendicular to the plane of the polarization filter (4).
- (20)claimed in claim 5, The device as 6. the rotation 20 in that οf the characterized polarization filter (4) can be provided appropriate means (7) directly by hand or else with the aid of a transmission mechanism, and in that, in particular, the rotation of the filter 25 (4) through at least 180 degrees is preferably possible.
- 7. The device (20) as claimed in claim 5, characterized in that the polarization filter (4) 30 can be rotated with the aid of a motor, and in that in this case the polarization filter (4) can be rotated with a rotation frequency in the range from 0.2 to 5 Hz, in particular preferably with a rotation frequency from 0.5 to 2 Hz.

35

8. The device (20) as claimed in one of the preceding claims, characterized in that the device is configured in the form of a pen which has a

cylindrical housing to accommodate at least one battery and a diode (18) and a lower cylindrical housing part (2), the lower housing part (2) forming a dark chamber (17) with an observation opening (10), with which the object (8) to be observed can be covered, the instrument (20) in particular preferably having a length of less than 10 centimeters and, at its thickest point, a diameter of less than 2.5 cm.

10

15

5

- 9. The device (20) as claimed in claim 8, characterized in that the observation opening (10) in the lower housing part (2) is formed in the form of a segment cutout extending from the lower edge (11) of the lower housing part (2) with an opening angle in the range from 90 to 150 degrees with a height of less than 1.5 cm.
- The device (20) as claimed in one of claims 1 to 10. 4. characterized in that 2 groups of at least one 20 UV light source or UV diode (18) in each case, preferably of 2 UV diodes (18) in each case, are arranged, and in that these 2 groups irradiate the object (8) in a predefined, alternating manner, the first group (18a) throwing a cone of light 25 (12) with a first polarization direction onto the object (8), and the second group (18b) throwing a cone of light (12) with a second polarization object (8), and the first direction onto the polarization direction being aligned substantially 30 second polarization perpendicular to the direction.
- 11. The device (20) as claimed in claim 10, characterized in that the UV light sources or UV diodes (18) are switched on and off alternately in groups, the change between the two groups being carried out at a frequency of 0.2 to 5 Hz, in

WO 03/085608 25

particular preferably at a frequency of 0.5 to 2 Hz.

PCT/CH03/00192

12. The device (20) as claimed in claim 10, 5 characterized in that the UV light sources or UV diodes (18) of the 2 groups are activated with a substantially sinusoidal intensity profile, shift between the 2 groups phase being substantially 90 degrees.

10

13. The device (20) as claimed in one of claims 10 to 12, characterized in that there are two groups of respectively two UV light sources or UV diodes (18), in each case UV light sources or UV diodes 15 (18) belonging to one group (18a; 18b) being arranged opposite each other in relation to the observation axis and the two groups being arranged displaced by 90 degrees around to be the observation axis.

20

14. The device (20)as claimed in claim 13, characterized in that a polarization filter is arranged in front of each UV light source or UV diode (18), the orientation of the polarization 25 direction of the polarization filters of the first aligned (18a) being substantially group perpendicular to the orientation of polarization direction of the polarization filters of the second group (18b).

30

15. device (20) as claimed in claim characterized in that a cylindrical polarization filter (30) is arranged between object (8) and UV light sources or UV diodes (18), the axis of the 35 cylindrical polarization filter (30) substantially coinciding with the observation axis the polarization direction of the UV light (12)passing through the polarization filter (30)

likewise being arranged parallel to the observation axis.

- 16. The device (20) as claimed in claim 15, characterized in that the cylindrical polarization filter (30) consists of a rolled polarization film.
- 17. The device (20) as claimed in one of claims 10 to
 10 16, characterized in that a holding arm (26) and
 an observation tube (21) are provided, the
 observation tube being aligned substantially at
 right angles to the holding arm (26).
- 15 18. The device (20) as claimed in one of the preceding claims, characterized in that the observation is carried out through a lens, in particular preferably through a magnifying glass.
- 20 19. The device (20) as claimed in one of the preceding claims, characterized in that the observation is carried out by means of electronic aids, in particular in the form of a recording device such as a camera, in particular a digital camera, if appropriate in combination with a corresponding electronic visualization means such as a display.
- 20. The device (20) as claimed in one of the preceding claims, characterized in that the observation is 30 carried out through a polarization filter which, in particular, preferably substantially does not permit light in the wavelength range of the UV diode (18) to pass, while light in the wavelength range of the photoluminescent light (16) from the segment can pass substantially only in a manner 35 with filtered respect to its polarization direction.

WO 03/085608 PCT/CH03/00192

27

21. The device (20) as claimed in one of the preceding claims, characterized in that means for verifying further security features are provided at the same time.

5

10

15

- (20) 22. device as claimed in claim 21, the permit characterized in that means the verification of magnetic, electric, optical, electronic, electro-optical features, preferably selected from the group comprising bar codes, magnetic strips, conductivity, electroluminescence, photoluminescence, conversion (anti-Stokes), infrared signatures, electronically readable texts, also including infrared text (OCR text), X-ray fluorescence features.
- A method of revealing security elements that are 23. present in an object (8) and that have at least 20 one photoluminescent segment which characterized by linearly polarized absorption, characterized in that light from at least one light source in the form of a UV light source or preferably a UV diode (18) is linearly polarized 25 (12) by at least one polarization filter (4), is incident on the object (8) or, respectively, the photoluminescent segments present therein in a dark chamber (17), and photoluminescent light (16) in the visible range from the segment is 30 observed through an observation opening (10), the method being carried out in particular with the aid of a device (20) as claimed in one of claims 1 to 22.
